NATIONAL CANCER TRENDS FOR AAs AND NHPIs\textsuperscript{[1][2][3]}

National cancer trends (1990-2008) among Native Hawaiians and Pacific Islanders (NHPIs) and Asian Americans (AAs) identified persistent cancer disparities and new ethnic-specific issues. NHPIs share a similar burden in common cancers such as breast, prostate, lung, and colorectal as non-Hispanic Whites (NHW), but they face higher risks from cancers such as stomach, liver, and uterus. In addition, NHPIs have higher cancer incidence rates compared to AAs. Increasing cancer incidence rates among Samoans and Guamanians/Chamorros and differences for Native Hawaiians in Hawai‘i versus the mainland are key areas of concern. Further understanding social factors such as migration, acculturation, and geography may provide insights for reducing NHPI cancer disparities.

According to CDC, Asian Americans are the only racial group in which cancer is the leading cause of death. Among AAs, breast cancer was the most common cancer, followed by prostate, lung, colorectal, liver, and stomach cancers. AAs continue to experience the lowest screening rates (breast, cervical, colorectal cancers) compared to all other racial groups. Disparities in cancer incidence and mortality after diagnosis are more evident among foreign-born, low income AAs and those living in ethnic enclaves. Targeted ethnic-specific community prevention and screening efforts are critical to reducing AA cancer disparities.

IMPACT OF CANCER ON AAs AND NHPIs\textsuperscript{[1][2][4]}

- Among NHPI women, increase in cancer incidence was found in breast, uterine, and colorectal cancers among Samoan women.
- Among NHPIs, increase in overall cancer incidence was found among Guamanians/Chamorros.
- Samoan women experienced higher rates of stomach (4.8 times) and uterine (3.3 times) cancers compared to Non-Hispanic White women.
- Samoan men experienced higher rates of liver (3.8 times), stomach (2.8 times), and lung (1.3 times) cancers compared to Non-Hispanic White men.
- Among AAs, screening rates for breast (64.1%), cervical (75.4%), and colorectal (46.9%) cancer were the lowest compared with all other racial groups.
- Among AA women, increasing cancer incidence were found in uterine (Asian Indians, Chinese, Filipina, Japanese), colorectal (Koreans, Laotians, Vietnamese), lung (Filipinas, Koreans), thyroid (Filipinas), and breast cancer (most AAs).
- Among AA men, increasing cancer incidence were found for prostate (Asian Indians and Pakistanis, Filipinos, Koreans, Kampuchean), liver (Filipinos, Vietnamese, Kampuchean), and colorectal (Koreans) cancers.
- Southeast Asian women: Kampuchean (24.8), Laotian (23.7), and Vietnamese (20.9) women have the higher rates of liver cancer compared with Non-Hispanic White women.
- Southeast Asian men: Laotian (64.5), Vietnamese (58.5), and Kampuchean (52.7) have the higher rates of liver cancer compared with Non-Hispanic White men.
California has the nation's largest population of Asian Americans (AAs) with almost 5 million individuals. AAs comprise of 13.14% (4.92% in the U.S.) of the state population and 39.26% of the minority population in the state. The state also has the second largest Native Hawaiian and Pacific Islander (NHPI) population (0.39% of NHPIs versus the national average of 0.17%). Both Asians (1,356,391) and NHPIs (26,143) predominately reside in Los Angeles County.

Source: U.S. Census Bureau, 2009-2011 American Community Survey 

- 37.68% (14,064,741) of California's population are Hispanic or Latino. (Federal agencies only recognize five race categories: White, African American, American Indian and Alaska Native, Asian American, and Native Hawaiian and Pacific Islander. The federal government considers race and Hispanic/Latino origin to be two separate and distinct concepts.)

Native Hawaiians and Pacific Islanders (NHPI) refer to persons with ancestry from any of the three major sub-regions: Polynesian, Micronesian and Melanesian. About 0.39% of California’s population is Native Hawaiian and Pacific Islander. As a group, Polynesians, including Native Hawaiian, Samoan, and Tongan, are the fastest growing Pacific Islanders in California. Tongans have grown 30.98% from 2007 to 2011. Currently, Samoans are the largest group, making up 27.97% of California’s NHPI population.
LANGUAGES SPOKEN

Asian Americans, Native Hawaiians, and Pacific Islanders speak over 100 languages and dialects. In California, 52.53% (790,403) of native Asian Americans and 8.75% (274,678) of foreign-born Asian Americans speak English only. Of Asian Americans who speak other language(s) besides English, 17.74% (126,679) of native Asians and 55.74% (1,595,757) of foreign-born speak English not well or not at all. In contrast, 62.34% (61,732) of native Native Hawaiians and Pacific Islanders and 11.39% (4,208) of foreign-born Native Hawaiians and Pacific Islanders speak English only. Of Native Hawaiians and Pacific Islanders who speak other language(s) besides English, 17.55% (6,545) of natives and 39.16% (12,819) of foreign-born speak English not well or not at all.

The most common cancers in male Asian American, Native Hawaiian, and Pacific Islander (AA and NHPI) groups are prostate, lung, and colorectal. Koreans have a greater propensity to be diagnosed with stomach cancer than other AA and NHPI groups. For all AA and NHPI females, breast cancer is the most common, followed by lung, colorectal, uterine, and cervical cancers.
