NATIONAL CANCER TRENDS FOR AAs AND NHPIs\(^1\)[2][3]

National cancer trends (1990-2008) among Native Hawaiians and Pacific Islanders (NHPIs) and Asian Americans (AAs) identified persistent cancer disparities and new ethnic-specific issues. NHPIs share a similar burden in common cancers such as breast, prostate, lung, and colorectal as non-Hispanic Whites (NHW), but they face higher risks from cancers such as stomach, liver, and uterus. In addition, NHPIs have higher cancer incidence rates compared to AAs. Increasing cancer incidence rates among Samoans and Guamanians/Chamorros and differences for Native Hawaiians in Hawai'i versus the mainland are key areas of concern. Further understanding social factors such as migration, acculturation, and geography may provide insights for reducing NHPI cancer disparities.

According to CDC, Asian Americans are the only racial group in which cancer is the leading cause of death. Among AAs, breast cancer was the most common cancer, followed by prostate, lung, colorectal, liver, and stomach cancers. AAs continue to experience the lowest screening rates (breast, cervical, colorectal cancers) compared to all other racial groups. Disparities in cancer incidence and mortality after diagnosis are more evident among foreign-born, low income AAs and those living in ethnic enclaves. Targeted ethnic-specific community prevention and screening efforts are critical to reducing AA cancer disparities.

IMPACT OF CANCER ON AAs AND NHPIs\(^1\)[2][4]

- Among NHPI women, increase in cancer incidence was found in breast, uterine, and colorectal cancers among Samoan women.
- Among NHPIs, increase in overall cancer incidence was found among Guamanians/Chamorros.
- Samoan women experienced higher rates of stomach (4.8 times) and uterine (3.3 times) cancers compared to Non-Hispanic White women.
- Samoan men experienced higher rates of liver (3.8 times), stomach (2.8 times), and lung (1.3 times) cancers compared to Non-Hispanic White men.
- Among AAs, screening rates for breast (64.1%), cervical (75.4%), and colorectal (46.9%) cancer were the lowest compared with all other racial groups.
- Among AA women, increasing cancer incidence were found in uterine (Asian Indians, Chinese, Filipina, Japanese), colorectal (Koreans, Laotians, Vietnamese), lung (Filipinas, Koreans), thyroid (Filipinas), and breast cancer (most AAs).
- Among AA men, increasing cancer incidence were found for prostate (Asian Indians and Pakistanis, Filipinos, Koreans, Kampuchean), liver (Filipinos, Vietnamese, Kampuchean), and colorectal (Koreans) cancers.
- Southeast Asian women: Kampuchean (24.8), Laotian (23.7), and Vietnamese (20.9) women have the higher rates of liver cancer compared with Non-Hispanic White women.
- Southeast Asian men: Laotian (64.5), Vietnamese (58.5), and Kampuchean (52.7) have the higher rates of liver cancer compared with Non-Hispanic White men.

- 17.74% (1,559,464) of New Jersey’s population are Hispanic or Latino. (Federal agencies only recognize five race categories: White, African American, American Indian and Alaska Native, Asian American, and Native Hawaiian and Pacific Islander. The federal government considers race and Hispanic/Latino origin to be two separate and distinct concepts.)

### NEW JERSEY’S MINORITY POPULATION

Asian Americans (AAs) make up 29.76% of the minority population in New Jersey while Native Hawaiians and Pacific Islanders (NHPIs) population make up 0.1%. Middlesex County has the most AAs (175,601), while Union County consists of the most NHPIs (724).

*Source: U.S. Census Bureau 2005-2007, 2009-2011 American Community Survey*

Native Hawaiian and Pacific Islander (NHPI) population of New Jersey is 0.03%. Native Hawaiians make up 27.73% of New Jersey’s NHPI’s population and is the only NHPI group (34.60%) in the state that is growing.
**LANGUAGES SPOKEN**

Asian Americans, Native Hawaiians, and Pacific Islanders speak over 100 languages and dialects. In New Jersey, 41.26% (68,595) of native Asian Americans and 9.51% (48,983) of foreign-born Asian Americans speak English only. Of Asian Americans who speak other language(s) besides English, 12.85% (12,554) of natives and 44.02% (205,236) of foreign-born speak English not well or not at all. 78.18% (1,372) of native Native Hawaiians and Pacific Islanders and 46.14% (239) of foreign-born Native Hawaiians and Pacific Islanders speak English only. Of Native Hawaiians and Pacific Islanders who speak other language(s) besides English, 22.72% (87) of natives and 54.48% (152) of foreign-born speak English not well or not at all.

<tr>
<td>NJ</td>
<td>$85,005</td>
<td>$34,936</td>
</tr>
</tbody>
</table>

Source: U.S Census Bureau 2009-2011 American Community Survey

Median family income of Asian Americans is much greater than that of whites and of New Jerseyans. However, per capita income is less due to a greater number of individuals living in Asian American households. Both median and per capita income for Native Hawaiians and Pacific Islanders is much lower than the state’s. This may be due to more individuals living in Native Hawaiians and Pacific Islanders households than there are in white households.

**EDUCATIONAL ATTAINMENT**

</tbody>
</table>

Source: U.S Census Bureau 2009-2011 American Community Survey

About 15% of Asian Americans (AAs) and 21% of Native Hawaiians and Pacific Islanders (NHPIs) are uninsured. While AAs and NHPIs account for 8.36% of the total New Jersey population, they account for about 10% of the uninsured population.
The most common cancers in Asian Americans, Native Hawaiians, and Pacific Islanders (AAs and NHPIs) are also common in whites, with the exception of thyroid. AAs and NHPIs also die from the same cancers as whites but suffer a higher rate of mortality from stomach cancer.

**CANCER INCIDENCE AND MORTALITY 2012, NEW JERSEY**

New Jersey Asian Americans, Native Hawaiians, and Pacific Islanders (AAs and NHPIs) had much lower cancer incidence rates for all cancers combined compared to Non-hispanic Whites. However, the most common cancer among AA and NHPI males and females in New Jersey are: prostate, lung, colorectal, breast, and thyroid. For all AAs and NHPIs, males experience higher mortality rates compared to females.
